

A Synthetic Note on Reproducible LaTeX Revision

LazyingArt project-owned sample

2 September 2026

Abstract

This synthetic document tests a small, reproducible LaTeX revision. It contains no customer material and makes no scientific claim.

1 Method

A manuscript revision should freeze complete old and revised source trees and build each one independently. The checked comparison state is represented by

$$R = (S_{\text{old}}, S_{\text{new}}), \tag{1}$$

where the two S terms are named source snapshots compiled with the same engine and dependency set.

Table 1: Artifacts checked in the revision workflow.

Artifact	Check
Baseline	Builds
Revision	Builds

2 Conclusion

A successful clean build is necessary but not sufficient. The two source snapshots in (1) remain separate and independently buildable.
